Our smart digital thermostat for electric heated towel rails.

**Synthesis Wi-Fi** is a digital electronic smart device which is great for temperature control in heated towel rails. It can be used in conjunction with a wide range of heating elements that can be easily connected to the Synthesis and are available from many third-part European manufacturers.

The 4-button on-board keypad allows the user to access a wide variety of functions, and the large back-lit display constantly shows all the information concerning the functioning of the thermostat through pleasantly coloured icons.

The functions packed in the device (comfort, night, anti-freeze, chrono and 2h boost mode) also include a pilot-wire mode, in case of such input arrangement. Chrono mode offers a separate programmable time schedule for each day of the week.

Advanced settings are available, such as keypad lock, to prevent young children from using it, and open window detection, which is useful when it comes to saving energy. When the thermostat is not in use, the display blends seamlessly with the rest of the device, guaranteeing a unique look no matter what part of the house it is installed in.

The wifi module allows complete iOS and Android integration through a dedicated app that makes living more comfortable and more convenient. All members of the family can access and control the heating system from anywhere at any time.

## Safety instructions

A damaged power cable **MUST** be replaced by the manufacturer, the manufacturer's customer service or qualified personnel to prevent potentially hazardous situations. Do not attempt any repair yourself.

### WARNING!

Power cords that are damaged, broken, modified, trapped under heavy objects, pulled hard or bent severely can cause electric shock and fire hazards! Please observe all warnings contained in this user's guide.

- The controller can be used to regulate the room temperature in conjunction with an electrical heating element in stationary and electrical radiators. Any other use is contrary to its intended purpose and therefore is considered a risk for the user

**Always ensure that power is disconnected before working on the heating element.**

- Connect the temperature controller only to electrical heating elements suitable to be connected to it  
- Ensure that the output of the heating element is approved for the available radiator size (see manufacturer's documentation).

The use of a heating element with a greater output:

✂ does not increase the effective output of the radiator

✂ can cause early depletion of the heating element

✂ could damage your radiator

- Ensure that the output of the heating element does not exceed the output of the controller (see typeplate)

- When installed in rooms with bath or shower facilities observe the protection zones (in the UK according to IEE Wiring Regulations). In addition, observe all the local regulations

- The device must be protected by a 30mA residual-current device (RCD)

- Only operate the device with the approved voltage (see specs on the element)

- If a device is connected directly to the fixed electrical installations, install a disconnector in accordance with the local regulation for mains disconnection

## Conditions of use

- Remember to store and transport the heating element only in the provided protective packaging.

- Make sure the towel rail body has no leaks or bubbles of air inside.

- You must leave some distance from any power outlets.

- The whole appliance should not come in contact with water.

- Connect the thermostat only to a heating element suitable to work with such kind of device.

- Check that the voltage is the same as specified in the technical specifications.

- Position the appropriate o-ring before the fixing area

- After making sure that the o-ring is well positioned, screw the heating element into the appropriate threaded hole in the towel warmer, tighten properly and insert the cover ring

- Remove the connecting cables from the thermostat. The 2 faston connectors and the ground connector (only for class I).

- Insert the 2 fastons into the relative connectors of the heating element

- Insert the female faston of the ground connection (class I only)

- Insert the lower part of the heating element into the thermostat that has just been connected

- The thermostat and the heating element should be lined up correctly. Do not rotate the thermostat for more than 30 degrees in either direction

- Press the thermostat against the base of the heating element to compress the o-ring, adequately tighten the appropriate screw so that the thermostat remains firmly fixed and does not rotate around the heating element

## Installation

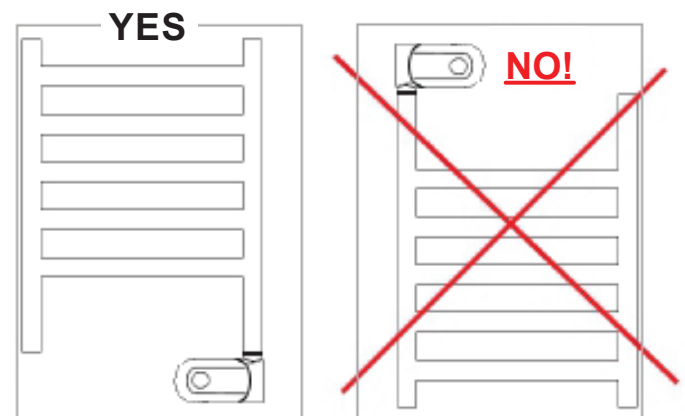

These steps should only be performed by a professional technician/installer.

**Caution**  
**Risk of electric shock!**

Please read these instructions carefully before using the device.

- This device has been designed to be used exclusively in conjunction with heated towel rails
- This thermostat is used to heat up the liquid contained inside of a heated towel rail in combination with a heating element. Every other use is prohibited
  - Before use, check that the mains voltage is the same as the one indicated on the thermostat (see technical specifications)
- Only use heating elements appropriate for the type of heated towel rail used
- Unplug the device before cleaning or maintenance
- In case you notice any kind of damage to the power cord, switch off the device and do not attempt any repair. Damaged power cables can be replaced only by the manufacturer or at an authorized service center. Failure to comply with the above may compromise the safety of the system and invalidate your warranty
- Store and transport the heating element and the thermostat in its protective packaging
- Replacement of the heating element can only be performed from authorized personnel

**Do NOT fill the towel rail body up to the rim with the heating fluid. Check and observe the recommended level. Do not overfill for any reason.**

## Heating element installation guide

- Do not install your heating element while the thermostat is plugged into the mains
- The thermostat must be connected to the heating element by qualified personnel
- Make sure that the resistance power does not exceed the allowed maximum power

Top-up the towel rail by removing one of the top plugs and fill it with water only allowing around 10% of the height for expansion when the water gets hot. If you are refilling a towel warmer from empty then a combination of 85% water and 15% corrosion inhibitor is recommended.

1. Insert the heating element into the threaded opening in the lower part of the towel rail.
2. Properly tighten the resistance with the electronic control to the towel warmer body.
3. The special gasket ensures the tightness of the assembly and allows a slight additional twist in case you need to align the thermostat with the towel warmer.
4. Tilt the heating rail to make sure that the top opening of the towel warmer is in the highest part.
5. Fill the heating rail with the appropriate liquid.
6. Position the towel warmer vertically and check the level of the internal liquid.
7. Make sure that the heating rail and the heating element are correctly tightened.
8. Connect the device to the mains and activate the heating. During this phase do not close the upper lid of the towel rail.
9. Set the maximum temperature and observe the increase in the liquid level. The fluid should not overflow. Remove liquid in excess (carefully avoid burning yourself) in order not to wet the thermostat and make sure that the liquid does not reach the edge.
10. When the liquid level stops rising, wait another 5 minutes and turn everything off.
11. If the towel warmer needs to be topped up, do not wait for it to cool. Always pay attention to the temperature of the internal liquid.
12. Close the upper opening of the heating rail with the dedicated cap.
13. Hook the towel warmer with the special supports to the wall.
14. Connect the thermostat to the mains. For versions without electric plug it is necessary to install an appropriate device to ensure complete omnipolar disconnection in case of overvoltage category III

## Keys and icons

### PLEASE NOTE

In case of a power outage or accidental disconnection from the mains, the thermostat will store the operating status it was in before the cut for at least 2 hours. If it remains off grid for longer, you will not lose your settings, but time and date will have to be set manually again. If the thermostat was in CHRONO mode and loses its settings, it will restart from the COMFORT mode.

## C. PILOT WIRE

Only in devices where this mode is present

In PILOT-WIRE mode, the appliance is controlled through a signal from a dedicated control unit that sets the operative mode for all connected thermostats. The only input needed from the user in this mode is the desired COMFORT temperature, which is set by pressing the **[+]** and **[-]** keys.

In this mode, 6 different signals can be detected, which correspond to the same number of operating modes:

1. **Standby**: keeps the heating element powered off, but the thermostat is maintained switched on
2. **Comfort**: the COMFORT temperature set by the user is maintained constant in the room by intelligently switching the heating element on and off
3. **ECO**: maintains a temperature which is always 3°C lower than COMFORT temperature
4. **Anti-freeze**: always keeps the room temperature higher than 7°C to avoid freezing
5. **Comfort-1**: maintains room temperature 1°C lower than COMFORT temperature
6. **Comfort-2**: maintains room temperature 2°C lower than COMFORT temperature

### How do I activate PILOT WIRE mode

- Press the **[mode]** key until the PILOT-WIRE icon appears on the display
- Set the desired temperature with the **[+]** and **[-]** keys and wait for the temperature on the display to stop flashing

### PLEASE NOTE

If a PILOT-WIRE cable is not detected, the default operating mode is the COMFORT mode.

## D. CHRONO MODE (ONLY SETTABLE BY SMARTPHONE APP)

Switching between COMFORT and NIGHT mode is automatically managed every day of the week according to the preset time schedule. This mode can be activated simply selecting this mode by pressing the **[mode]** key until the CHRONO mode icon appears on the display.

There are 3 different programmes you can choose from and the first 2 are preset. To switch among the 3 programmes, press the **[chrono]** button while in CHRONO mode.

## E. ANTI-FREEZE MODE

In this mode, room temperature is always kept above 7°C to prevent freezing.

To activate this mode, press the **[mode]** key until the ANTI-FREEZE icon appears on your display.

## F. BOOST 2H

In this mode maximum power is supplied to the heating element for 120 minutes, independently from the ambient temperature. For safety reasons the ambient temperature can never exceed 30°C, so a safety control mechanism will prevent that. When the time is over, the control will go back to the operating mode that was previously set before entering boost mode.

This setting will be triggered if a sudden drop in temperature of at least 1.5°C is detected. The function will be deactivated if a rise in temperature of at least 1.5 °C is detected, and heating will restart as normal. After 30 minutes in this mode, the device returns to the previously set mode anyway.

- When the function is activated, the open window detection icon blinks on the display
- When the device detects the open window the symbol remains on

## Why smart heating systems are important?

A well-designed smart heating system is just what the name says: a system which heats up your home in a smart way. Being able to control and monitor your heating system from your smartphone is becoming more and more a necessity in today's lifestyle, and therefore it's becoming more and more popular in homes around the world.

Not all smart home heating systems are created equally. Some won't let you set a schedule. Some won't provide remote access. Some others are just a hassle to operate. That's why we've created a system that promises the most efficient climate control. It helps you save energy and maximise your comfort. Our system works with many different devices and is easy to install. It adapts to your needs and to your home and will require minimum service.

## How does it work?

Different parts of your home require different heating behaviour. The more thermostats you have installed, the more customizable and reliable the heating system becomes.

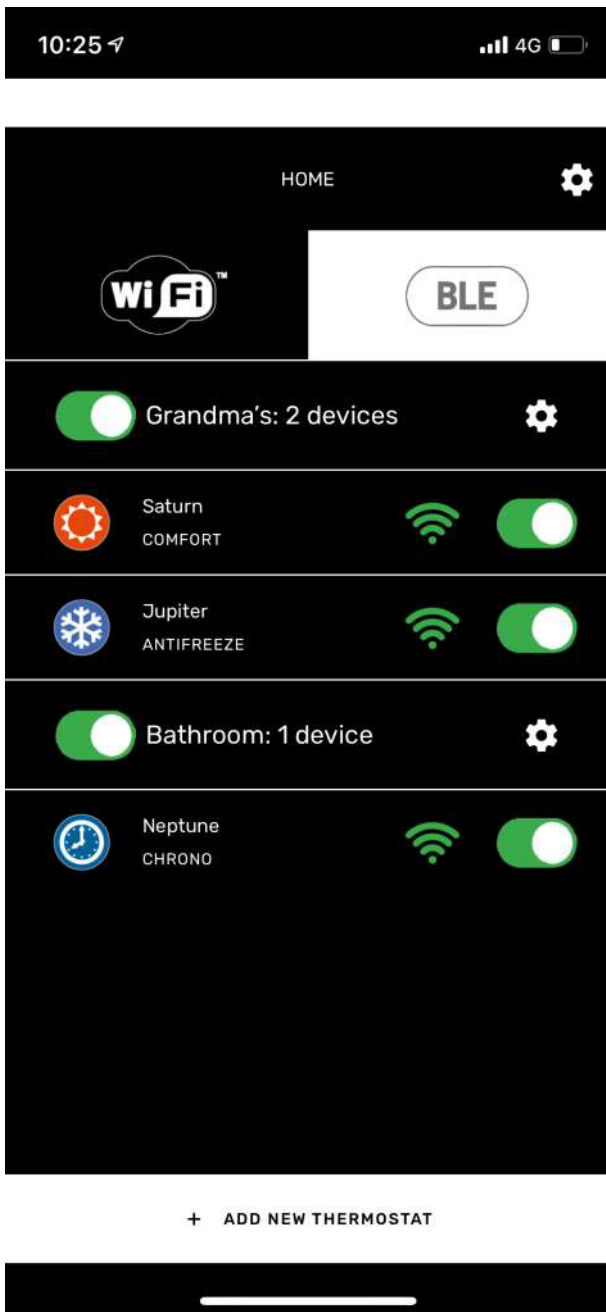

Once your thermostats are properly installed in radiators or towel rails, it's now time to let them go online. Our apps let you connect one thermostat at a time to your home Wi-Fi network. Each thermostat will then start to communicate constantly with a cloud server: this will allow remote and local control.

The second important step is adding each of your thermostats to your personal account. You can add more thermostats to your account and organise them into groups of thermostats.

# Features

## Thermostat groups

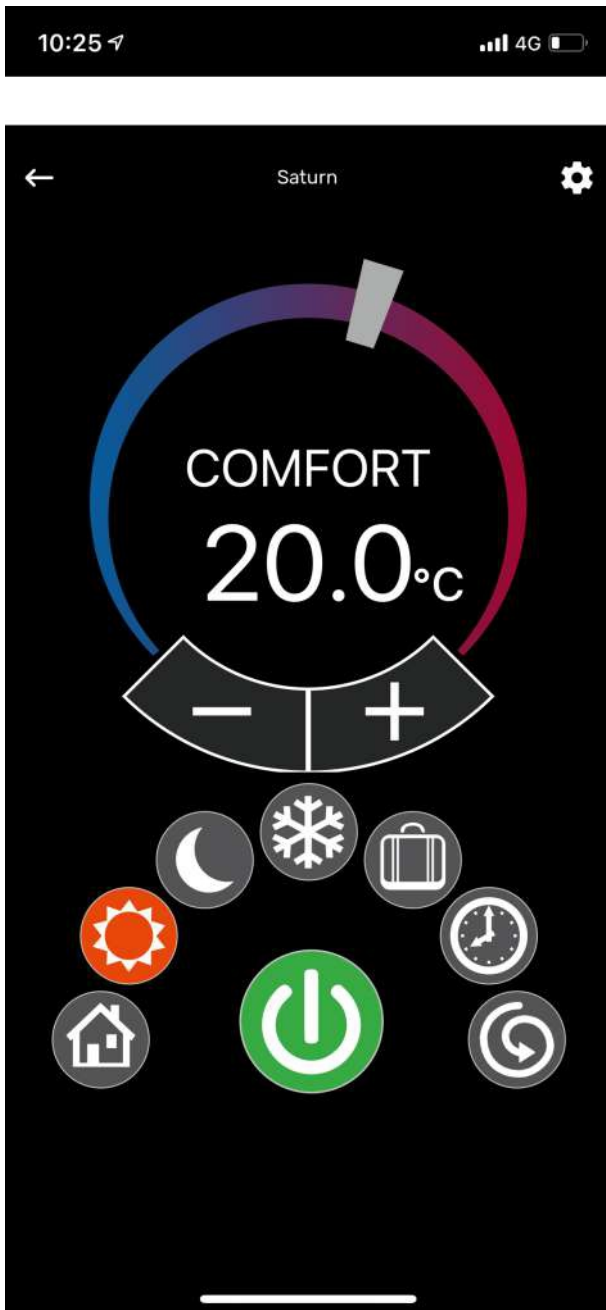

Thermostats are arranged into groups. A group can represent a room, a floor or a whole house. You can have different thermostats from different houses all registered into your account and control all of them directly from the same screen.

You can see the name of each thermostat and the mode it's currently in from this very useful page.

You can turn on and off all thermostats of the same group at the same time if all thermostats from that group are online. This is very useful when for example you're leaving the house and you want all of them to turn off with a single tap.

You can turn on and off one thermostat just by tapping on the relative toggle. A green button shows that the thermostat is on, grey means off. The Wi-Fi icon indicates if the thermostat has good Wi-Fi connection and is connected to the server.

This screenshot shows the 2 groups of thermostat of the account: Grandma's and Bathroom. All the thermostats are online and running in different heating modes.

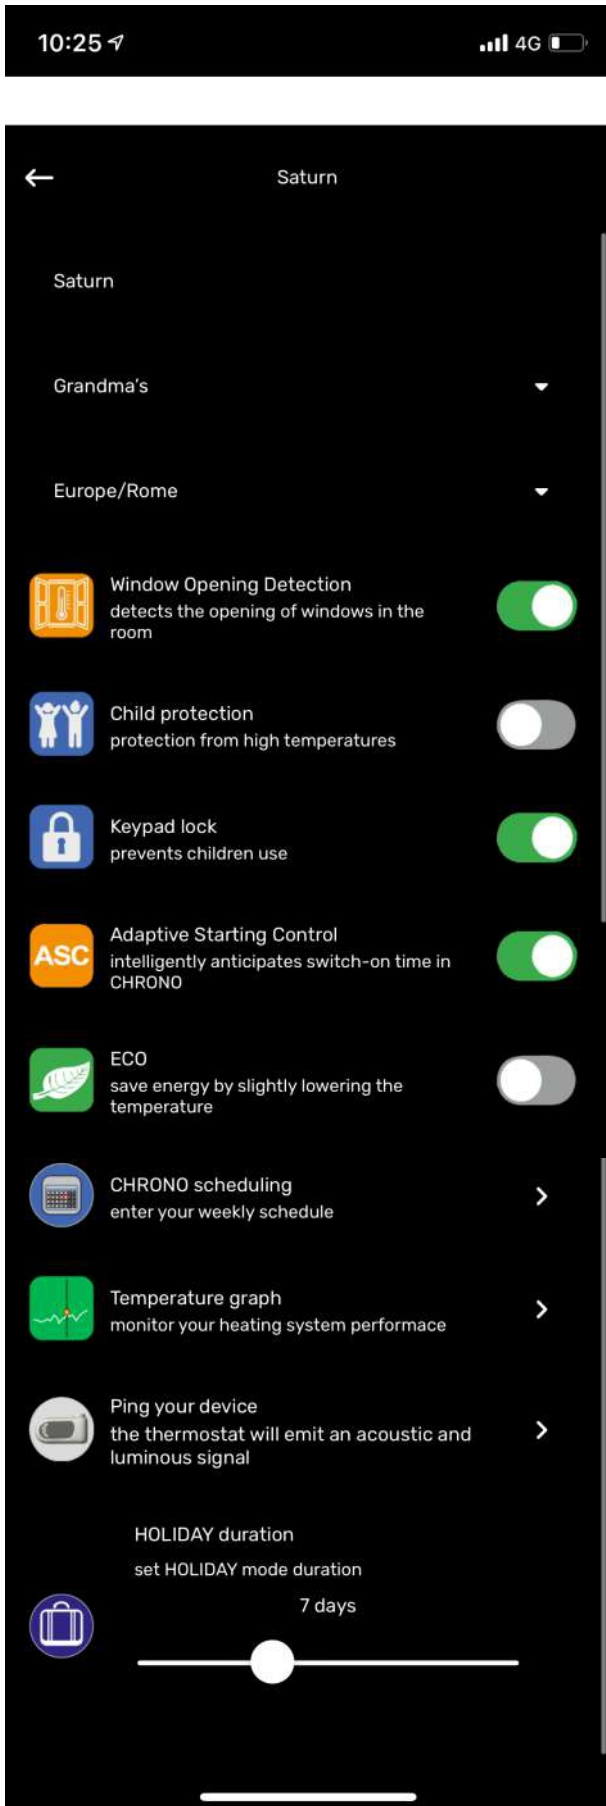

## Thermostat main page

This is the thermostat control page. The first half of the page shows a big temperature dial, just below the thermostat name. You can control the temperature by tapping on the [+] and [-] keys.

The second part of the page displays a series of keys which represent all the different modes available on the thermostat. They will vary dynamically depending on what model of thermostat you're controlling.

The key in colour represents the mode that's currently active. If you press the standby key, you'll turn off the thermostat: all icons will turn grey and you won't be able to change the temperature. To operate the thermostat please turn it back on again.

This screenshot shows the Saturn thermostat main page. COMFORT mode is selected, with a nice temperature of 20° C. Dark mode is activated on the device.

## Thermostat settings page

This is the thermostat settings page. You can control all the different thermostat settings from here.

You can rename the thermostat just by tapping on the name section. It's best to provide a name that clearly identifies the device.

You can move the thermostat to a different group just by tapping on the thermostat group name or the relative little arrow that will open the groups list.

You can change the thermostat time zone to match the one you're currently in. Time zone should be set automatically matching the time zone of your phone.

You can turn on and off all function with the toggles. All actions are explained in detail below every title.

Some sections could be opened and take you to a different section like 'CHRONO scheduling' and the 'TEMPERATURE graph'. These sections will be explained in detail in the following page.

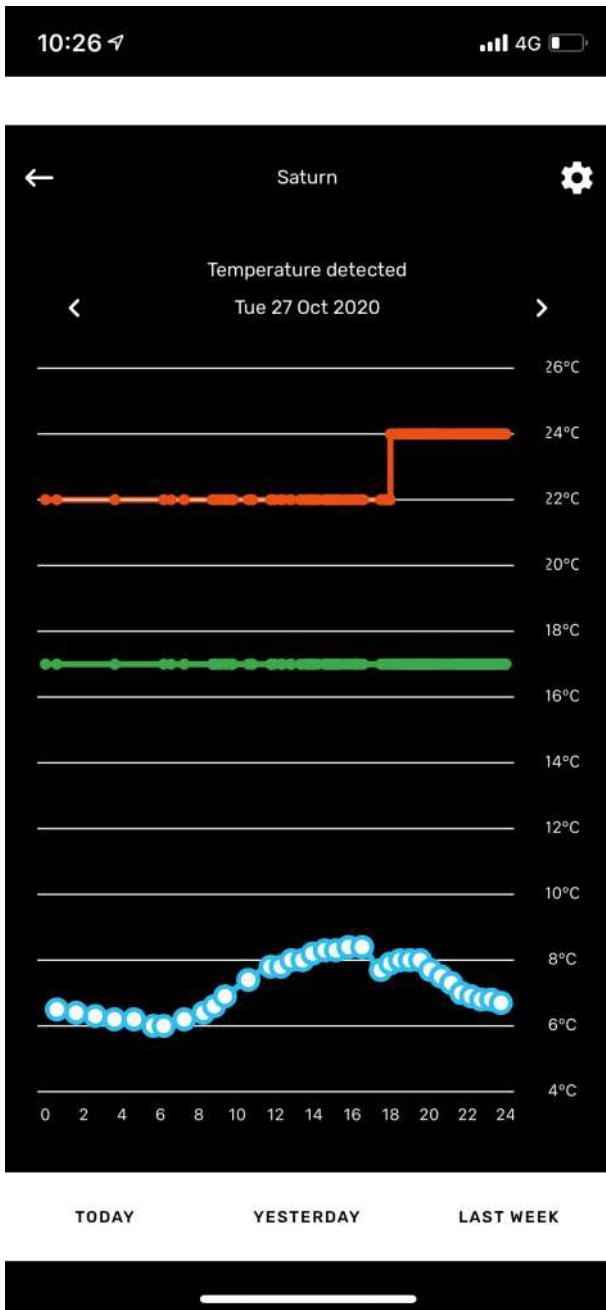

Depending on the model of thermostat you're using, you could see different settings from the ones shown here.

### Thermostat P3 CHRONO scheduling

You can configure the P3 CHRONO mode schedule from this section. Before entering this section you'll need to select P3 from the CHRONO mode in the main page.

By tapping on each hour you can turn them from COMFORT to NIGHT mode and vice-versa. Please repeat this action for every hour of the day and for every day of the week. When you're satisfied with the result just click on the save key at the top right hand corner of the page and the new programme will be applied.

## Temperature graph

This page will allow you to monitor the temperature of the room during the day and display all data in a beautiful format.

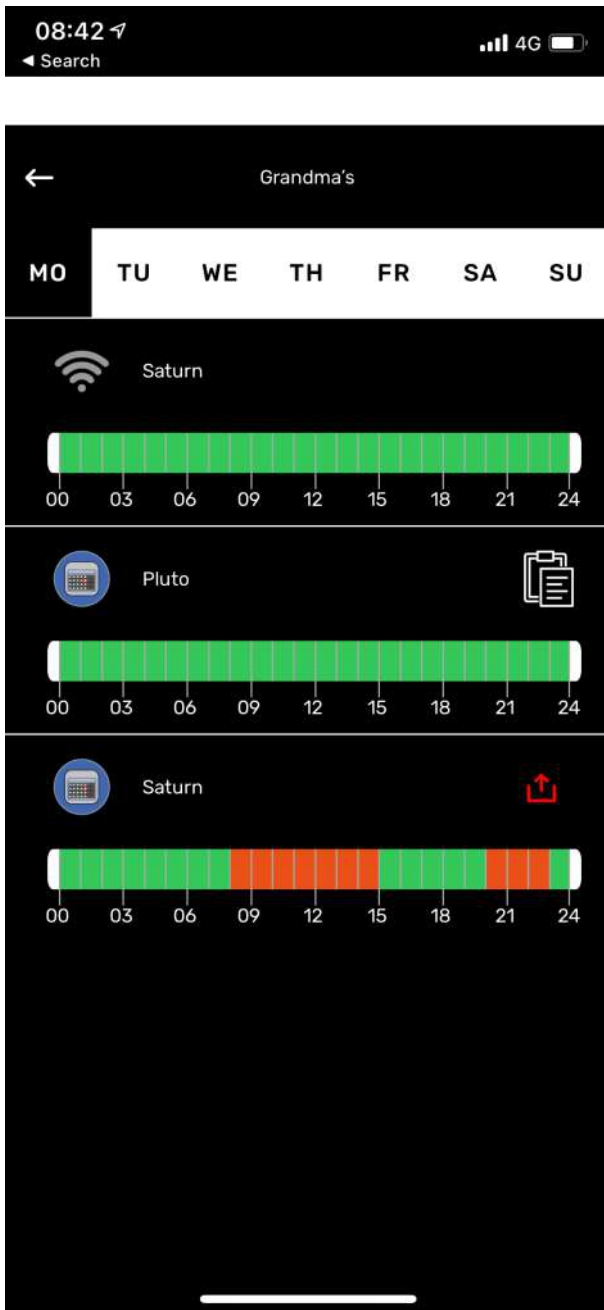

The red line represents the set COMFORT temperature, the green one represents the NIGHT temperature level and the light blue dots indicate the temperature detected in the room where the thermostat is installed.

You can move to the previous or following day by pressing on the little arrows on the right and left of the date respectively.

You can jump straight to today, yesterday and to last week views just by tapping on the keys at the bottom of the page. 'Last week' simply means the same day of today but one week in the past.

This page comes very useful when keep energy consumption under control.

## Schedule copy

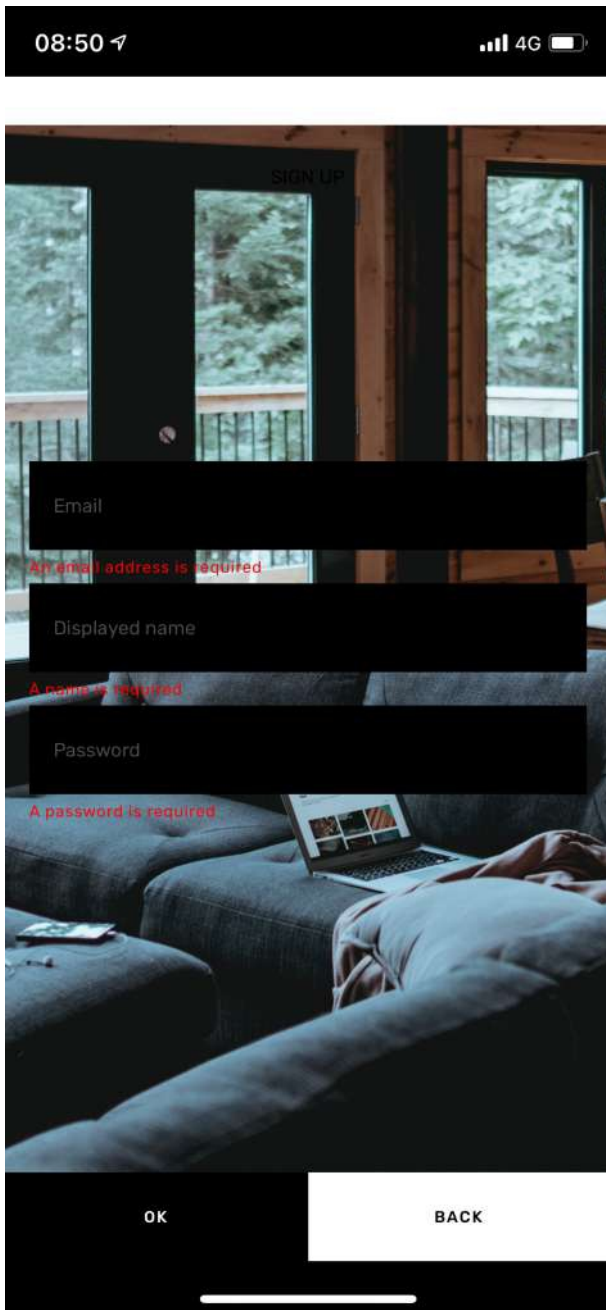

This function is useful when you want to sync thermostats that you want to work in unison, together at the same time. This function can be used only with compatible thermostats.

From the main page, if you tap on the gear symbol next to a group's name you will get access to a page like this one, which will allow copy and paste of the CHRONO schedule from one thermostat to another one within the same group.

First you need to tap on the copy icon next to the thermostat you want to copy from, and then tap on the paste symbol of the thermostat you want to paste to.

Please note that all 7 days will be copied at once and only the editable programme will be copied.

Thermostats must be online during the process, otherwise the function won't be available.

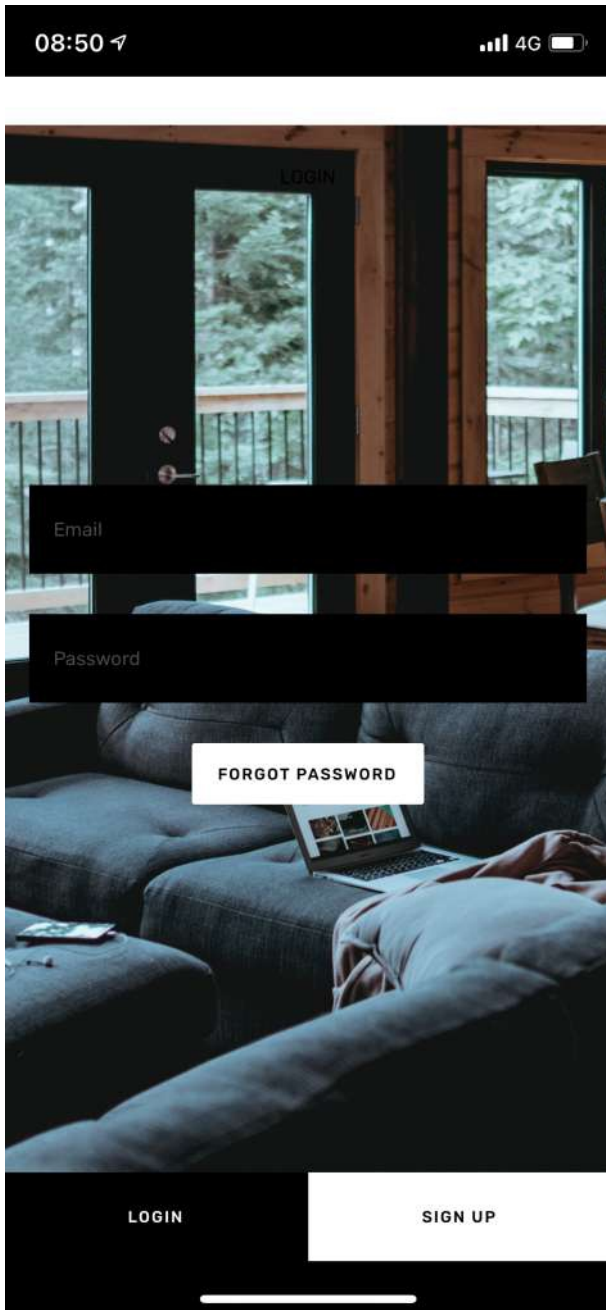

## Account sign up

When you open the app for the first time you will have to create a new account if you don't already have one.

You need to provide a valid email address, your name and a password to access your Domus One account.

Once you have created your account, you will be logged in automatically into the account that you have just created.

Please check that Location Services are active: you'll need that for the whole setup process.

## Account login

To log in simply type your email address and password. Tap [LOGIN] to confirm.

If you can't remember your password please tap on [FORGOT PASSWORD]. A reset link will be sent to the email address you provided.

Please check the spelling of your email address when you try resetting your password as we cannot tell if there's an account behind the address that you type.

If you don't receive the reset password email within a few minutes, please check your spam. If you still haven't received anything after a few minutes, try checking the spelling of your account email address and repeat the procedure.

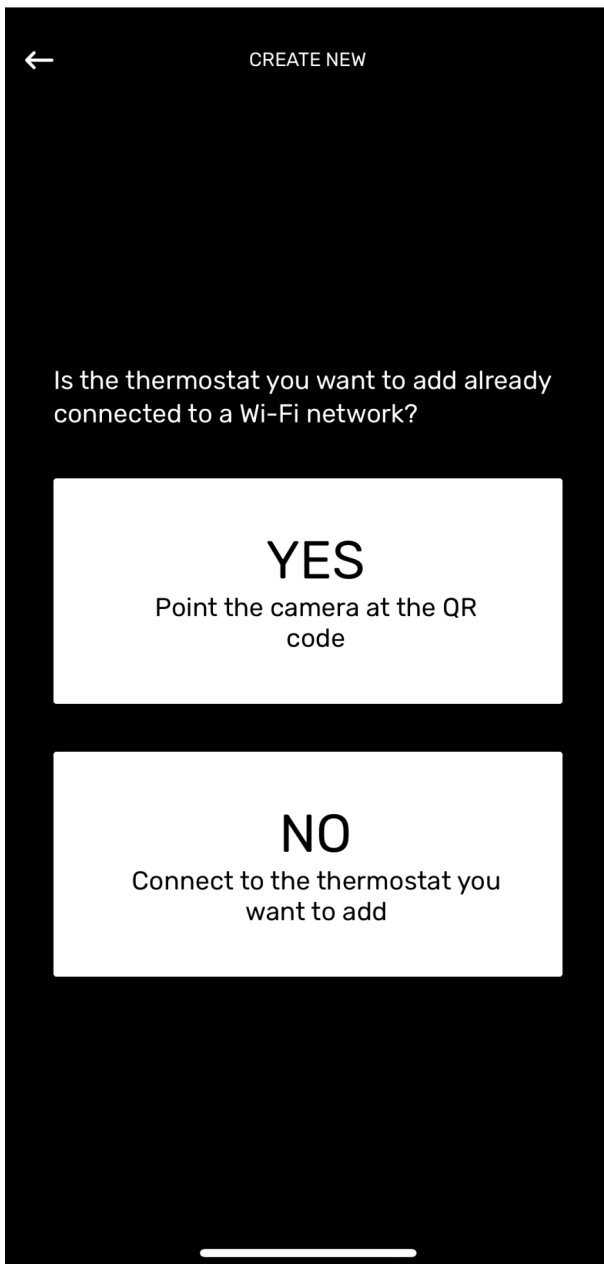

## Account setup

Once you have successfully logged into your account, you will be presented with the following screen. You can now start adding thermostats to your account.

We will now look into how you can add thermostats to your Wi-Fi section of your account. You can start by tapping on [+ Add new thermostat].

If you click on the little gear symbol on the top right hand corner of the page you can log out of your account.

You can use the BLE section to connect to compatible thermostats locally.

### How does this whole procedure work?

First you'll have to connect the physical thermostat to your domestic Wi-Fi network.

Please note that locations services should be switched on when this whole operation is being carried out.

Please note that we only support 2.4 GHz Wi-Fi with the following network protection methods:

- WPA-PSK
- WPA2-PSK
- open network (no security implemented)

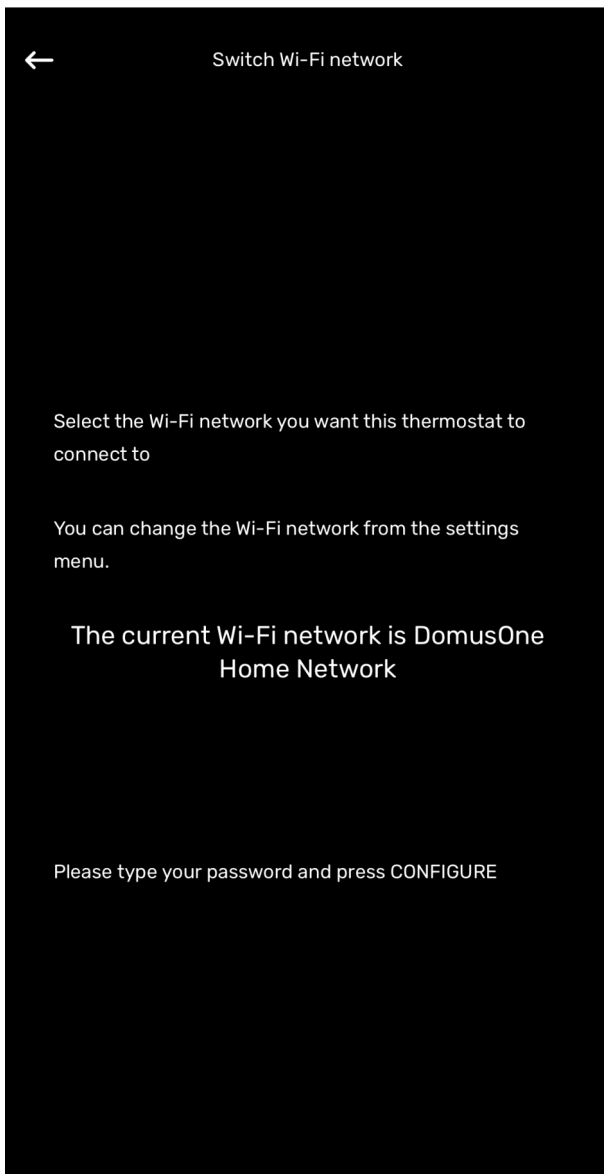

Please note that we do not support any other methods such as WEP (systems that still use WEP aren't secure.)

Also, Wi-Fi SSID network names and passwords cannot exceed 50 characters.

### How do I connect my thermostat to my domestic Wi-Fi network?

1. Join your domestic Wi-Fi network through your phone settings. You must be connected and the network should have access to the Internet.
2. Tap [+Add new thermostat] and then [NO] in the screen on the left.

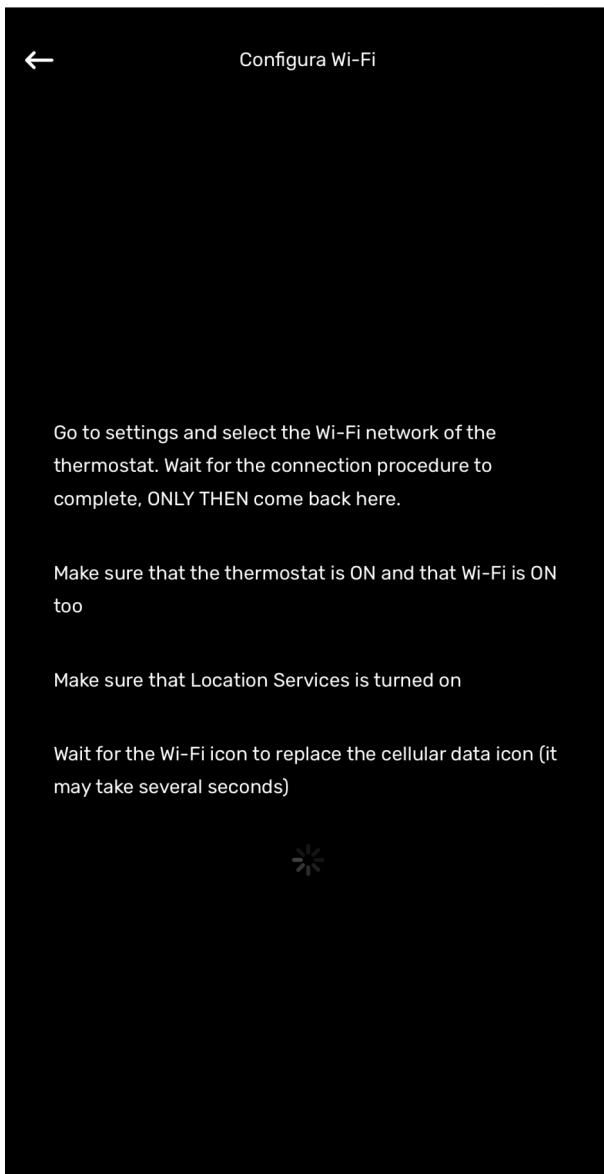

CONFIGURE

GO TO SETTINGS

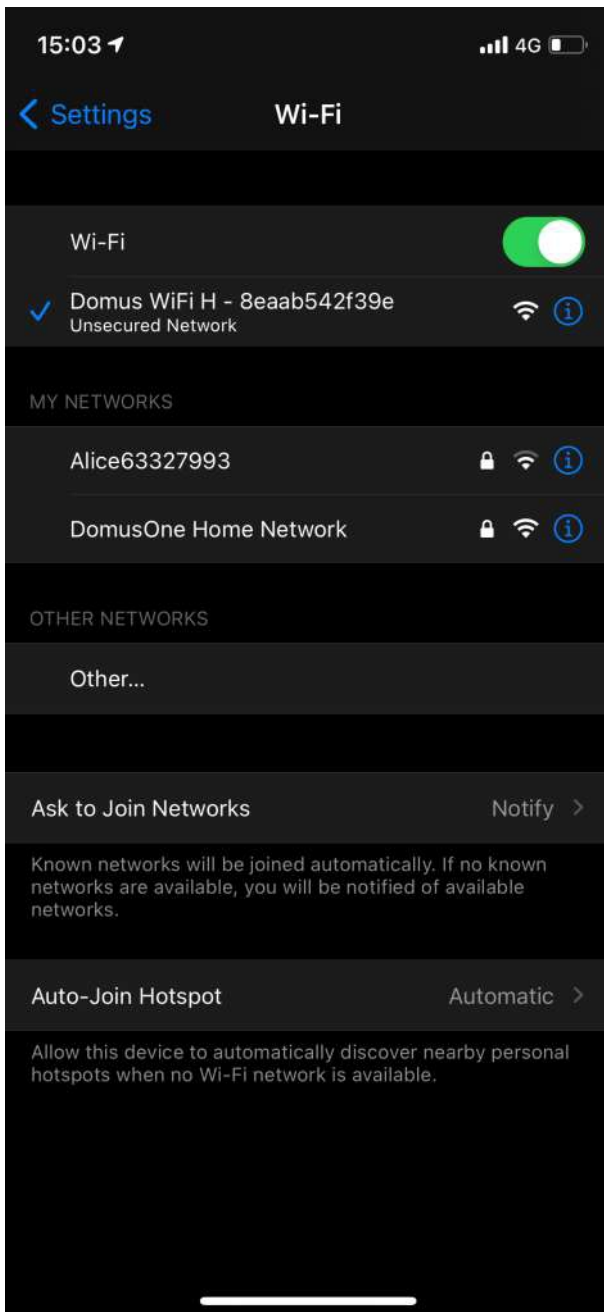

**3.** Now type the Wi-Fi password of the domestic Wi-Fi network and tap [CONFIGURE]. If no password is required, simply leave the section empty and tap [CONFIGURE].

If you you're not connected to your desired Wi-Fi home network, tap on [GO TO SETTINGS], join that network and then come back here on the app.

Please note that if you type the password incorrectly and proceed with the next steps, the thermostat won't be able to join the Wi-Fi home network. You'll have to reset the thermostat manually. Please refer to the thermostat user guide.

4. Now you need to leave the Domus One app and get to your phone Wi-Fi Settings. You can jump straight to settings by tapping on the relative key at the bottom of the page.

5. Now you need to join the Wi-Fi network that is being generated by your thermostat. This part is extremely delicate. For iOs, you need to wait for the Wi-Fi symbol to replace the cellular one on the top right hand corner. This usually takes a few seconds but can last up to 2 minutes.

For Android, make sure that the connection is established (some phones may require a confirmation from the user).

**ONLY THEN** you need to go back to the Domus One app.

6. Wait for the thermostat setup to be completed. A confirmation message will pop up.

7. Now you need to tap on [+ Add new thermostat] again and then on [YES] and frame the QR code of the thermostat. Please select the group you want the thermostat to be put into. You can even create a new group or select it among the ones that are already there.

8. Repeat the procedure (1 to 7) for all the thermostats you want to add to your account.

9. If you want to delete a thermostat from your account just long tap on the thermostat name and select delete.

## FAQ (Frequently asked questions)

### **1. The app isn't detecting which domestic Wi-Fi network my phone is connected to.**

You need to activate Location Services for the app to detect Wi-Fi networks and grant the app access to that option.

### **2. The thermostat cannot connect to my Wi-Fi network even through the SSID and password are correct.**

Please check that the Wi-Fi network complies with the requirements mentioned before.

### **3. I tried resetting my password but still haven't received any email.**

Please check the spelling of your email address when you try resetting your password as we cannot tell if there's an account behind the address that you type.

If you don't receive the reset password email within a few minutes, please check your spam. If you still haven't received anything after a few minutes, try checking the spelling of your account email address and repeat the procedure.

### **4. I cannot get access to my account with my credentials**

Please check that your device is connected to the Internet and double check the spelling of your credentials.

### **5. I had already added a thermostat to another account successfully. Can I add it to another account?**

Sure thing. If the thermostat is still connected to the Wi-Fi network you want to use you can tap on [+Add new thermostat] and [YES] and follow the instructions. A thermostat can be added to more account at the same time, but if you prefer keeping it only in the last account you can delete from the first account.

### **6. Can I change the Wi-Fi network the thermostat is connected to?**

Sure. All you need to do is reset the thermostat (please follow the thermostat user guide). Then you'll need to follow the whole **Create new** procedure (tap on [+ Add new thermostat]).

**7. Once I join the thermostat-generated Wi-Fi network and go back to the app, nothing happens and I cannot proceed with the configuration.**

For iOS, you need to wait for the Wi-Fi symbol to replace the cellular one on the top right hand corner. This usually takes a few seconds but can last up to 2 minutes.

For Android, make sure that the connection is established (some phones may require a confirmation from the user). **ONLY THEN** you need to go back to the Domus One app.

**8. I can't turn on/off all thermostats at the same time**

If you want to do this, all the thermostats you want to control must be in the same group and be connected to the Internet.
